Dear Hiring Manager,

I am a Junior Software Developer who is excited to create things and solve problems. I create UIs that are intuitive , professional and powerful for clients using REACT.js, JavaScript and CSS. I use several different back-end storage or database options including MongoDB, MSSQL, Firebase, connecting to them with node.js, express and axios. My current work is refactoring an app for an educational consulting company. With a MERN stack I am making a traditionally installed software application web-based while also improving the look and feel. I'm finding it to be a nice learning curve and very rewarding.

I would like to join a team that uses a similar technology stack so I can contribute immediately and then continue to learn and grow my skill set by working with a company and developers that have proven processes in place.

If given the opportunity you will find that I'm an energetic person that has a positive impact on the team's performance as well as general culture and wellbeing.

Kind regards,

Michael Samara
